

## Chapter 15) Building Feed API and pagination

### → Feed API

- the people to whom my user can connect to (either by you or others) /
- not show the interested, ignored, ignored by others, connections and himself
- these cards should not be seen in user feed.
- Except all these, he should be able to see others in DB (→ I will limit it on the basis of location, seniority, and skills) or any batching algorithm.  
(I will make it highly advance).

// Read about MongoDB logical operators.

// use set to hide certain users from feed of particular users.

// we have already discussed the cases when this arises,

// read about comparison query from MongoDB docs.

(I will add some more advance things from my side).

### → Moving towards pagination

/feed ? page = 1 & limit = 10 ⇒ first 10 users from DB.

## MongoDB functions to achieve this

- skip ( )  $\longrightarrow$  by default  $> 0$
- limit ( )  $\longrightarrow$  by default) all the documents in DB

// sanitize the query params

$\rightarrow$  page or limit can't be more than a certain value, especially "limit".

$\rightarrow$  make all the response and error in a standard format (use class of JS)
